PRIORITY CLAIM UNDER RULE 55

The benefit of the filing date in Germany of a patent application corresponding to the above-identified application is hereby claimed under Rule 55 and 35 U.S.C. 119 in accordance with the Paris Convention for the Protection of Industrial Property. A certified copy of the corresponding patent application bearing Serial No. 03020089.3, filed on 4 September 2003, is attached hereto.

Respectfully submitted,

Date: 17 September 2007 Stephan Blicker et al.

Push-to-talk Interworking

The present invention relates to interworking between separate communication networks using dialled connections and especially to a push-to-talk communication method for enabling a subscriber to communicate with one or more subscribers of one or more communication networks without using a dialling procedure.

It is state of the art to use a dialling procedure in digital communication systems to set up a communication path between two subscribers of a communication network.

20 Within the text of this patent or patent application the abbreviation "PoC" shall mean Push-to-talk over Communication system "PoC AS" shall mean Push-to-talk over Communication system Application Server

Push-to-Talk Interworking between different Operators - Technical Solution

For Push-to-Talk service it will be essential to interwork between

30 different operators (e.g. interworking between Operator 1 and Operator

2). As there is no standard mechanism specified in order to realise the interworking, the following technical solution is proposed.

Push-To-Talk enables a user to send a message either streamed or transferred at one to one or a group of users after pressing a button or initialising a start signal in an other known technique. Special actions have to be taken to organise a Push-To-Talk Group across operators.

In the following the necessary mechanisms are explained.

40 ·

Fig. 1 shows the situation when both operators offer groups to each other

T03025 EF .

· -2-

- · Operator1 and Operator2 negotiate a contract, that Operator2 is allowed to offer the group poc-group@op2.net and Operator1 offers the group poc-group@op1.net
- User n+1 to m join the group poc-group@op2.net from Op1 side
- User 1 to n join the group poc-group@opl.net from Op2 side 5
 - Synchronisation takes place between Operator1 and Operator2 PoC Servers, so the group members of poc-group@op1.de and poc-group@op2.net are known for Operator2 and Operatorl as well
- Synchronisation automatically by PoC servers 10
 - Synchronisation in case a user requests update of all group members before sending a PoC message
- Fig. 2 shows the situation when only operator 2 offers groups to 15 customers of operator 2 and 1
 - Operator1 and Operator2 negotiate a contract, that Operator2 is allowed to offer the group
- poc-group@op2.net 20
 - User n+1 to m join the group poc-group@op2.net from Op1 side
 - User 1 to n join the group poc-group@op2.net from Op2 side
 - Synchronisation takes place between Operator1 and Operator2 PoC Servers, so the group members of
- poc-group@op2.de are known for Operator1 and Operator2 as well 25
 - Synchronisation automatically by PoC servers
 - Synchronisation in case a user requests update of all group members before sending a PoC message
- 30 Fig. 3 shows the Push-to-Talk User Signalling/Traffic Flow (Alternative I)
- A user m logged to Op1 presses the PoC button, all or parts of the members of the poc-group@op2.net are known/not known in the Op1 PoC 35 server due to synchronisation/request mechanism
 - The messages are terminated towards all users except User m logged on to Op1 and to the users of the group logged on to Op2
- The PoC server may generates billing records and Interconnection (IC) records for accounting 40

T03025 EP

7 LIA MUNUMEN

- The PoC AS of Op1 acts as proxy for a single user of poc-group@op2.net logged on to the operator 1 network and contact the PoC master server for the group located at operator 2
- The server of Operator 2 may be identified by a address derived from the group address

Fig. 4 shows the Push to Talk User Signalling/Traffic Flow (Alternative II)

10

20

25

- A user m logged to Opl presses the PoC button, all or parts of the members of the poc-group@op2.net are known/not known in the Opl PoC server due to synchronisation/request mechanism
- The messages are terminated towards all users except User m logged on to Op1 and to the users of the group logged on to Op2
 - The PoC server may generates billing records and Interconnection (IC) records for accounting
 - The PoC AS of Opl acts as proxy for a single user of poc-group@op2.net logged on to the operator 1 network and contact the PoC master server for the group located at operator 2
 - The PoC As may also act as partial PoC group server (partial group proxy) for all users of poc-group@op2.net logged on to the operator 1 network and contact the PoC master server for the group poc-group@op2.net. The traffic between the servers may be a server-server connection combining the traffic of the partial groups.
 - The server of Operator 2 may be identified by a address derived from the group address
- 30 Fig. 5 shows the Push-to-Talk User Signalling/Traffic Flow (Alternative III)
 - A user m logged to Opl presses the PoC button, the message is routed to the poc-server of Operator2
- o The messages are terminated towards all users except User m logged on to Opl and to the users of the group logged on to Opl
 - 1. The PoC server may generates billing records and Interconnection (IC) records for accounting
- The server of Operator 2 may be identified by a address derived from the group address

-4-

General:

15

The above mechanisms may be used for Push-To-Talk systems or any other system using group communication in any form.

The mechanisms apply to fixed/wireless and circuit/packet based communication networks.

10 Any address scheme (e.g. IP-address, phone numbers, SIP-URIS, ULRs, email-addresses) may be used to identify the users and groups.

Dedicated signalling protocols are used to exchange information about the groups (e.g. size, member, status of the members).

The mechanisms may be used with 3 or more operators simultaneously.

30

- 1. Method for operating a push-to-talk communication between a PoC-group consisting of at least of one member of a first communication network and a PoC-group consisting of at least of one member of a second communication network, using a PoC application server in each communication network
- 10 characterised by the steps of
 - connecting the members of the PoC-group of the first network operator with the members of the PoC-group of the second network operator
 - synchronising the PoC application servers to each other.
 - 2. Method for operating a push-to-talk communication according to claim 1 characterised by the steps of
 - connecting the members of the PoC-group of the first network operator from the side of the second network operator and
 - connecting the members of the PoC-group of the second network operator from the side of the first network operator
 - synchronising the PoC application servers to each other.
- 3. Method for push-to-talk communication between the members of an exiting push-to-talk communication session and a group of an additional communication network, using a PoC application server in each communication network

characterised by the steps of

- connecting the additional group to each of the existing groups of the session and
- synchronising the PoC application server of the additional group to the previously synchronised PoC application servers.
- 4. System for push-to-talk communication between push-to-talk groups of at least two communication networks
 characterised by one common group management system and at least one
 subsystem for each operator consisting of at least one Push-to-talk
 Communication Application Server (PoC AS).
